#### MATH 1553, JANKOWSKI MIDTERM 3, SPRING 2018, LECTURE C

Name		GT Email	@gatech.edu
------	--	----------	-------------

Write your section number here:

Please **read all instructions** carefully before beginning.

- Please leave your GT ID card on your desk until your TA matches your exam.
- The maximum score on this exam is 50 points.
- You have 50 minutes to complete this exam.
- There are no aids of any kind (calculators, notes, text, etc.) allowed.
- Show your work unless specified otherwise. A correct answer without appropriate work will receive little or no credit.
- You may cite any theorem proved in class or in the sections we covered in the text.
- Good luck!

On problem 1, you do not need to justify your answer, and there is no partial credit. a) Write a  $2 \times 2$  matrix A which is invertible but not diagonalizable. The remaining problems are true or false. Answer true if the statement is always true. Otherwise, answer false. In every case, assume that the entries of the matrix A are real numbers. Т b) F If *A* is an  $n \times n$  matrix and det(*A*) = 2, then 2 is an eigenvalue of A. If A is the  $3 \times 3$  matrix satisfying  $Ae_1 = e_2$ ,  $Ae_2 = e_3$ , and c) Т F  $Ae_3 = e_1$ , then det(*A*) = 1. The matrices  $A = \begin{pmatrix} 2 & 1 \\ 0 & -1 \end{pmatrix}$  and  $B = \begin{pmatrix} 2 & 2 \\ 0 & -1 \end{pmatrix}$  are similar. Т F d) e) Т F If *A* is an invertible  $n \times n$  matrix and *B* is similar to *A*, then *B* is invertible. f) Т F If A is an  $n \times n$  matrix and v and w are eigenvectors of A, then v + w is also an eigenvector of A.

Extra space for scratch work on problem 1

#### Problem 2.

Short answer. Show your work on part (b). In every case, the entries of each matrix must be real numbers.

a) Write a 2 × 2 matrix *A* for which  $\begin{pmatrix} 1 \\ 0 \end{pmatrix}$  and  $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$  are eigenvectors corresponding to the same eigenvalue.

**b)** Find the area of the triangle with vertices (0,0), (1,2), and (4,4).

c) Write a 3 × 3 matrix A with only one real eigenvalue  $\lambda = 5$ , such that the 5-eigenspace for A is a two-dimensional plane in  $\mathbb{R}^3$ .

**d)** Suppose *A* is an  $n \times n$  matrix. Which of the following must be true? Circle all that apply.

I. If *A* is diagonalizable, then *A* has *n* distinct eigenvalues.

II. If det(A) = 0 then *A* is not invertible.

### Problem 3.

[10 points]

Consider the matrix

$$A = \begin{pmatrix} 4 & -6 \\ 2 & -2 \end{pmatrix}$$

**a)** Find all eigenvalues of *A*. Simplify your answer.

- **b)** For the eigenvalue with negative imaginary part, find an eigenvector.
- **c)** Using the eigenvalue with negative imaginary part, find a matrix *C* that is a composition of of rotation and scaling and which is similar to *A*.
- **d)** Write the scale factor for *C*.
- e) By what counterclockwise angle does your matrix *C* rotate? Simplify your answer (don't leave it in terms of arctan), as it is a standard angle.

## Problem 4.

 $\operatorname{Let} A = \begin{pmatrix} -3 & 0 & -4 \\ 0 & 3 & 0 \\ 6 & 0 & 7 \end{pmatrix}.$ **a)** Find the eigenvalues of *A*. b) Find a basis for each eigenspace of A. Mark your answers clearly. c) Is A diagonalizable? If your answer is yes, find a diagonal matrix D and an invertible matrix *P* so that  $A = PDP^{-1}$ . If your answer is no, justify why *A* is not diagonalizable.

# Problem 5.

[10 points]

Parts (a) and (b) are not related.

**a)** Find det(
$$A^3$$
) if  $A = \begin{pmatrix} 1 & -3 & 4 & 2 \\ 0 & 0 & -2 & 0 \\ 0 & 1 & 2 & 3 \\ 2 & 0 & -1 & 20 \end{pmatrix}$ .

**b)** Find the  $2 \times 2$  matrix *A* whose eigenspaces are drawn below. Fully simplify your answer. (to be clear: the dashed line is the (-2)-eigenspace).
