

Supplemental problems: §§2.6, 2.7, 2.9, 3.1

1. Circle **T** if the statement is always true, and circle **F** otherwise. You do not need to explain your answer.
- a) If $\{v_1, v_2, v_3, v_4\}$ is a basis for a subspace V of \mathbf{R}^n , then $\{v_1, v_2, v_3\}$ is a linearly independent set.
 - b) The solution set of a consistent matrix equation $Ax = b$ is a subspace.
 - c) A translate of a span is a subspace.

Solution.

- a) True. If $\{v_1, v_2, v_3\}$ is linearly dependent then $\{v_1, v_2, v_3, v_4\}$ is automatically linearly dependent, which is impossible since $\{v_1, v_2, v_3, v_4\}$ is a basis for a subspace.
 - b) False. this is true if and only if $b = 0$, i.e., the equation is *homogeneous*, in which case the solution set is the null space of A .
 - c) False. A subspace must contain 0.
2. True or false (justify your answer). Answer true if the statement is *always* true. Otherwise, answer false.
- a) There exists a 3×5 matrix with rank 4.
 - b) If A is an 9×4 matrix with a pivot in each column, then
$$\text{Nul}A = \{0\}.$$
 - c) There exists a 4×7 matrix A such that nullity $A = 5$.
 - d) If $\{v_1, v_2, \dots, v_n\}$ is a basis for \mathbf{R}^4 , then $n = 4$.

Solution.

- a) False. The rank is the dimension of the column space, which is a subspace of \mathbf{R}^3 , hence has dimension at most 3.
- b) True.
- c) True. For instance,

$$A = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}.$$

- d) True. Any basis of \mathbf{R}^4 has 4 vectors.

3. Find bases for the column space and the null space of

$$A = \begin{pmatrix} 0 & 1 & -3 & 1 & 0 \\ 1 & -1 & 8 & -7 & 1 \\ -1 & -2 & 1 & 4 & -1 \end{pmatrix}.$$

Solution.

The RREF of $(A \mid 0)$ is

$$\left(\begin{array}{ccccc|c} 1 & 0 & 5 & -6 & 1 & 0 \\ 0 & 1 & -3 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{array} \right),$$

so x_3, x_4, x_5 are free, and

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix} = \begin{pmatrix} -5x_3 + 6x_4 - x_5 \\ 3x_3 - x_4 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix} = x_3 \begin{pmatrix} -5 \\ 3 \\ 1 \\ 0 \\ 0 \end{pmatrix} + x_4 \begin{pmatrix} 6 \\ -1 \\ 0 \\ 1 \\ 0 \end{pmatrix} + x_5 \begin{pmatrix} -1 \\ 0 \\ 0 \\ 0 \\ 1 \end{pmatrix}.$$

Therefore, a basis for $\text{Nul } A$ is $\left\{ \begin{pmatrix} -5 \\ 3 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 6 \\ -1 \\ 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} -1 \\ 0 \\ 0 \\ 0 \\ 1 \end{pmatrix} \right\}$.

To find a basis for $\text{Col } A$, we use the pivot columns as they were written in the *original* matrix A , not its RREF. These are the first two columns:

$$\left\{ \begin{pmatrix} 0 \\ 1 \\ -1 \end{pmatrix}, \begin{pmatrix} 1 \\ -1 \\ -2 \end{pmatrix} \right\}.$$

4. Find a basis for the subspace V of \mathbf{R}^4 given by

$$V = \left\{ \begin{pmatrix} x \\ y \\ z \\ w \end{pmatrix} \text{ in } \mathbf{R}^4 \mid x + 2y - 3z + w = 0 \right\}.$$

Solution.

V is $\text{Nul } A$ for the 1×4 matrix $A = (1 \ 2 \ -3 \ 1)$. The augmented matrix $(A \mid 0) = (1 \ 2 \ -3 \ 1 \mid 0)$ gives $x = -2y + 3z - w$ where y, z, w are free variables. The parametric vector form for the solution set to $Ax = 0$ is

$$\begin{pmatrix} x \\ y \\ z \\ w \end{pmatrix} = \begin{pmatrix} -2y + 3z - w \\ y \\ z \\ w \end{pmatrix} = y \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \end{pmatrix} + z \begin{pmatrix} 3 \\ 0 \\ 1 \\ 0 \end{pmatrix} + w \begin{pmatrix} -1 \\ 0 \\ 0 \\ 1 \end{pmatrix}.$$

Therefore, a basis for V is

$$\left\{ \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 3 \\ 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} -1 \\ 0 \\ 0 \\ 1 \end{pmatrix} \right\}.$$

5. a) True or false: If A is an $m \times n$ matrix and $\text{Nul}(A) = \mathbf{R}^n$, then $\text{Col}(A) = \{0\}$.
 b) Give an example of 2×2 matrix whose column space is the same as its null space.
 c) True or false: For some m , we can find an $m \times 10$ matrix A whose column span has dimension 4 and whose solution set for $Ax = 0$ has dimension 5.

Solution.

- a) If $\text{Nul}(A) = \mathbf{R}^n$ then $Ax = 0$ for all x in \mathbf{R}^n , so the only element in $\text{Col}(A)$ is $\{0\}$.
 Alternatively, the rank theorem says

$$\dim(\text{Col } A) + \dim(\text{Nul } A) = n \implies \dim(\text{Col } A) + n = n \implies \dim(\text{Col } A) = 0 \implies \text{Col } A = \{0\}.$$

- b) Take $A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$. Its null space and column space are $\text{Span}\left\{\begin{pmatrix} 1 \\ 0 \end{pmatrix}\right\}$.

- c) False. The rank theorem says that the dimensions of the column space ($\text{Col}A$) and homogeneous solution space ($\text{Nul}A$) add to 10, no matter what m is.

6. Suppose V is a 3-dimensional subspace of \mathbf{R}^5 containing $\begin{pmatrix} 1 \\ -4 \\ 0 \\ 0 \\ 0 \end{pmatrix}$, $\begin{pmatrix} 1 \\ 0 \\ -3 \\ 1 \\ 0 \end{pmatrix}$, and $\begin{pmatrix} 9 \\ 8 \\ 1 \\ 0 \\ 1 \end{pmatrix}$.

Is $\left\{ \begin{pmatrix} 1 \\ -4 \\ 0 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 1 \\ 0 \\ -3 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 9 \\ 8 \\ 1 \\ 0 \\ 1 \end{pmatrix} \right\}$ a basis for V ? Justify your answer.

Solution.

Yes. The Basis Theorem says that since we know $\dim(V) = 3$, our three vectors will form a basis for V if and only if they are linearly independent.

Call the vectors v_1, v_2, v_3 . It is very little work to show that the matrix $A = \begin{pmatrix} v_1 \\ v_2 \\ v_3 \end{pmatrix}$

has a pivot in every column, so the vectors are linearly independent.

7. a) Write a 2×2 matrix A with **rank** 2, and draw pictures of $\text{Nul}A$ and $\text{Col}A$.

b) Write a 2×2 matrix B with **rank 1**, and draw pictures of $\text{Nul } B$ and $\text{Col } B$.

c) Write a 2×2 matrix C with **rank 0**, and draw pictures of $\text{Nul } C$ and $\text{Col } C$.

(In the grids, the dot is the origin.)

8. For each matrix A , describe what the transformation $T(x) = Ax$ does to \mathbf{R}^3 geometrically.

$$\text{a) } \begin{pmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{b) } \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}. \quad \text{c) } \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{d) } \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

Solution.

a) We compute

$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} -x \\ y \\ z \end{pmatrix}.$$

This is the reflection over the yz -plane.

b) We compute

$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ z \end{pmatrix}.$$

This is projection onto the z -axis.

c) We compute

$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} x \\ -y \\ z \end{pmatrix}.$$

This is the reflection over the xz -plane.

d)

$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} y \\ x \\ 0 \end{pmatrix}.$$

This is projection onto the xy -plane, followed by reflection over the line $y = x$.
