

**Supplemental problems: §3.4**

1. Consider  $T: \mathbf{R}^2 \rightarrow \mathbf{R}^3$  defined by

$$T \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} x + 2y \\ 2x + y \\ x - y \end{pmatrix}$$

and  $U: \mathbf{R}^3 \rightarrow \mathbf{R}^2$  defined by first projecting onto the  $xy$ -plane (forgetting the  $z$ -coordinate), then rotating counterclockwise by  $90^\circ$ .

- a) Compute the standard matrices  $A$  and  $B$  for  $T$  and  $U$ , respectively.
- b) Compute the standard matrices for  $T \circ U$  and  $U \circ T$ .
- c) Circle all that apply:
 

$T \circ U$ is:	one-to-one	onto
$U \circ T$ is:	one-to-one	onto

2. Let  $T: \mathbf{R}^3 \rightarrow \mathbf{R}^2$  be the linear transformation which projects onto the  $yz$ -plane and then forgets the  $x$ -coordinate, and let  $U: \mathbf{R}^2 \rightarrow \mathbf{R}^2$  be the linear transformation of rotation counterclockwise by  $60^\circ$ . Their standard matrices are

$$A = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{and} \quad B = \frac{1}{2} \begin{pmatrix} 1 & -\sqrt{3} \\ \sqrt{3} & 1 \end{pmatrix},$$

respectively.

- a) Which composition makes sense? (Circle one.)

$$U \circ T \quad T \circ U$$

- b) Find the standard matrix for the transformation that you circled in (b).

3. Find all matrices  $B$  that satisfy

$$\begin{pmatrix} 1 & -3 \\ -3 & 5 \end{pmatrix} B = \begin{pmatrix} -3 & -11 \\ 1 & 17 \end{pmatrix}.$$

4. Let  $T$  and  $U$  be the (linear) transformations below:

$$T(x_1, x_2, x_3) = (x_3 - x_1, x_2 + 4x_3, x_1, 2x_2 + x_3) \quad U(x_1, x_2, x_3, x_4) = (x_1 - 2x_2, x_1).$$

- a) Which compositions makes sense (circle all that apply)?  $U \circ T$      $T \circ U$
- b) Compute the standard matrix for  $T$  and for  $U$ .
- c) Compute the standard matrix for each composition that you circled in (a).

5. True or false (justify your answer). Answer true if the statement is *always* true. Otherwise, answer false.
- a) If  $A$  and  $B$  are matrices and the products  $AB$  and  $BA$  are both defined, then  $A$  and  $B$  must be square matrices with the same number of rows and columns.
  - b) Suppose  $T : \mathbf{R}^n \rightarrow \mathbf{R}^m$  and  $U : \mathbf{R}^m \rightarrow \mathbf{R}^p$  are onto linear transformations. Then  $U \circ T$  must be onto.
  - c) Suppose  $T : \mathbf{R}^n \rightarrow \mathbf{R}^m$  and  $U : \mathbf{R}^m \rightarrow \mathbf{R}^p$  are one-to-one linear transformations. Then  $U \circ T$  is one-to-one.
6. In each case, use geometric intuition to either give an example of a matrix with the desired properties or explain why no such matrix exists.
- a) A  $3 \times 3$  matrix  $P$ , which is not the identity matrix or the zero matrix, and satisfies  $P^2 = P$ .
  - b) A  $2 \times 2$  matrix  $A$  which is not the identity matrix and satisfies  $A^2 = I$ .
  - c) A  $2 \times 2$  matrix  $A$  satisfying  $A^3 = -I$ .
