## Section 3.4

Matrix Multiplication

#### Motivation

Recall: we can turn any system of linear equations into a matrix equation

$$Ax = b$$
.

This notation is suggestive. Can we solve the equation by "dividing by A"?

$$x \stackrel{??}{=} \frac{b}{A}$$

Answer: Sometimes, but you have to know what you're doing.

Today we'll study matrix algebra: adding and multiplying matrices.

These are not so hard to do. The important thing to understand today is the relationship between *matrix multiplication* and *composition of transformations*.

### More Notation for Matrices

Let A be an  $m \times n$  matrix.

We write  $a_{ij}$  for the entry in the *i*th row and the *j*th column. It is called the *ij*th entry of the matrix.

The entries  $a_{11}$ ,  $a_{22}$ ,  $a_{33}$ ,... are the **diagonal entries**; they form the **main diagonal** of the matrix.

A diagonal matrix is a *square* matrix whose only nonzero entries are on the main diagonal.

The  $n \times n$  identity matrix  $I_n$  is the diagonal matrix with all diagonal entries equal to 1. It is special because  $I_n v = v$  for all v in  $\mathbb{R}^n$ .

$$\begin{pmatrix} \underbrace{a_{11}}_{a_{12}} a_{12} & a_{13} \\ a_{21} & \underbrace{a_{22}}_{a_{23}} a_{23} \end{pmatrix} \begin{pmatrix} \underbrace{a_{11}}_{a_{12}} a_{12} \\ a_{21} & \underbrace{a_{22}}_{a_{31}} \\ a_{32} \end{pmatrix}$$

$$\begin{pmatrix}
a_{11} & 0 & 0 \\
0 & a_{22} & 0 \\
0 & 0 & a_{33}
\end{pmatrix}$$

$$I_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

## More Notation for Matrices Continued

The **zero matrix** (of size  $m \times n$ ) is the  $m \times n$  matrix 0 with all zero entries.

The **transpose** of an  $m \times n$  matrix A is the  $n \times m$  matrix  $A^T$  whose rows are the columns of A. In other words, the ij entry of  $A^T$  is  $a_{ji}$ .

$$0 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$A \qquad A^{T}$$

$$\begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{pmatrix} \text{www} \begin{pmatrix} a_{11} & a_{21} \\ a_{12} & a_{22} \\ a_{13} & a_{23} \end{pmatrix}$$
flip

### Matrix Multiplication

Beware: matrix multiplication is more subtle than addition and scalar multiplication.

must be equal

Let A be an  $m \times n$  matrix and let B be an  $n \times p$  matrix with columns  $v_1, v_2, \dots, v_p$ :

$$B = \begin{pmatrix} | & | & | \\ v_1 & v_2 & \cdots & v_p \\ | & | & | \end{pmatrix}.$$

The **product** AB is the  $m \times p$  matrix with columns  $Av_1, Av_2, \dots, Av_p$ :

The equality is a definition 
$$AB \stackrel{\text{def}}{=} \begin{pmatrix} | & | & | \\ Av_1 & Av_2 & \cdots & Av_p \\ | & | & | \end{pmatrix}$$
.

In order for  $Av_1, Av_2, \ldots, Av_p$  to make sense, the number of columns of A has to be the same as the number of rows of B. Note the sizes of the product!

Example 
$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix} \begin{pmatrix} 1 & -3 \\ 2 & -2 \\ 3 & -1 \end{pmatrix} =$$

### The Row-Column Rule for Matrix Multiplication

The ij entry of C=AB is the ith row of A times the jth column of B:  $c_{ij}=(AB)_{ij}=a_{i1}b_{1j}+a_{i2}b_{2j}+\cdots+a_{in}b_{nj}.$ 

This is how everybody on the planet actually computes AB. Diagram (AB = C):

$$\begin{pmatrix} a_{11} & \cdots & a_{1k} & \cdots & a_{1n} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{i1} & \cdots & a_{ik} & \cdots & a_{in} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{m1} & \cdots & a_{mk} & \cdots & a_{mn} \end{pmatrix} \cdot \begin{pmatrix} b_{11} & \cdots & b_{1j} & \cdots & b_{1p} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ b_{k1} & \cdots & b_{kj} & \cdots & b_{kp} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ b_{n1} & \cdots & b_{nj} & \cdots & b_{np} \end{pmatrix} = \begin{pmatrix} c_{11} & \cdots & c_{1j} & \cdots & c_{1p} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ c_{i1} & \cdots & c_{ij} & \cdots & c_{ip} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ c_{m1} & \cdots & c_{mj} & \cdots & c_{mp} \end{pmatrix}$$

$$jth \ column \qquad ij \ entry$$

Example

### Composition of Transformations

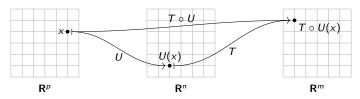

Why is this the correct definition of matrix multiplication?

#### Definition

Let  $T \colon \mathbf{R}^n \to \mathbf{R}^m$  and  $U \colon \mathbf{R}^p \to \mathbf{R}^n$  be transformations. The **composition** is the transformation

$$T \circ U \colon \mathbf{R}^p \to \mathbf{R}^m$$
 defined by  $T \circ U(x) = T(U(x))$ .

This makes sense because U(x) (the output of U) is in  $\mathbb{R}^n$ , which is the domain of T (the inputs of T). [interactive]

Fact: If T and U are linear then so is  $T \circ U$ .

Guess: If A is the matrix for T, and B is the matrix for U, what is the matrix for  $T \circ U$ ?

### Composition of Linear Transformations

Let  $T \colon \mathbf{R}^n \to \mathbf{R}^m$  and  $U \colon \mathbf{R}^p \to \mathbf{R}^n$  be *linear* transformations. Let A and B be their matrices:

$$A = \left(\begin{array}{cccc} | & | & | \\ T(e_1) & T(e_2) & \cdots & T(e_n) \\ | & | & | \end{array}\right) \quad B = \left(\begin{array}{cccc} | & | & | & | \\ U(e_1) & U(e_2) & \cdots & U(e_p) \\ | & | & | \end{array}\right)$$

#### Question

What is the matrix for  $T \circ U$ ?

The matrix of the composition is the product of the matrices!

## Addition and Scalar Multiplication for Linear Transformations Remark

We can also add and scalar multiply linear transformations:

$$T, U: \mathbf{R}^n \to \mathbf{R}^m \quad \text{with} \quad T + U: \mathbf{R}^n \to \mathbf{R}^m \quad (T + U)(x) = T(x) + U(x).$$

In other words, add transformations "pointwise".

$$T: \mathbf{R}^n \to \mathbf{R}^m$$
  $c \text{ in } \mathbf{R}$   $\sim cT: \mathbf{R}^n \to \mathbf{R}^m$   $(cT)(x) = c \cdot T(x)$ .

In other words, scalar-multiply a transformation "pointwise".

The next slide describes these operations in terms of matrix algebra.

### Addition and Scalar Multiplication for Matrices

You add two matrices component by component, like with vectors.

$$\begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{pmatrix} + \begin{pmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \end{pmatrix} = \begin{pmatrix} a_{11} + b_{11} & a_{12} + b_{12} & a_{13} + b_{13} \\ a_{21} + b_{21} & a_{22} + b_{22} & a_{23} + b_{23} \end{pmatrix}$$

Note you can only add two matrices of the same size.

You multiply a matrix by a scalar by multiplying each component, like with vectors.

$$\mathbf{c} \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{pmatrix} = \begin{pmatrix} \mathbf{c} a_{11} & \mathbf{c} a_{12} & \mathbf{c} a_{13} \\ \mathbf{c} a_{21} & \mathbf{c} a_{22} & \mathbf{c} a_{23} \end{pmatrix}.$$

These satisfy the expected rules, like with vectors:

If linear transformations T and U have matrices A and B, respectively:

- ightharpoonup T + U has matrix A + B.
- ► cT has matrix cA.

# Composition of Linear Transformations Example

Let  $T: \mathbf{R}^3 \to \mathbf{R}^2$  and  $U: \mathbf{R}^2 \to \mathbf{R}^3$  be the matrix transformations

$$T(x) = \begin{pmatrix} 1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix} x \qquad U(x) = \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 1 \end{pmatrix} x.$$

Then the matrix for  $T \circ U$  is

$$\begin{pmatrix} 1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & -1 \\ 1 & 2 \end{pmatrix}$$

[interactive]

## Composition of Linear Transformations Another Example

Let  $T: \mathbb{R}^2 \to \mathbb{R}^2$  be rotation by 45°, and let  $U: \mathbb{R}^2 \to \mathbb{R}^2$  scale the *x*-coordinate by 1.5. Let's compute their standard matrices *A* and *B*:

$$\implies \quad A = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix} \qquad B = \begin{pmatrix} 1.5 & 0 \\ 0 & 1 \end{pmatrix}$$

## Composition of Linear Transformations

Another example, continued

So the matrix C for  $T \circ U$  is

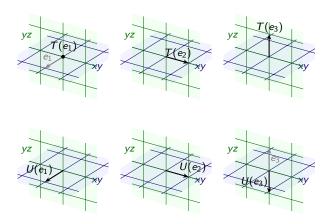

Check: [interactive: 
$$e_1$$
] [interactive:  $e_2$ ]

$$\implies C = \frac{1}{\sqrt{2}} \begin{pmatrix} 1.5 & -1 \\ 1.5 & 1 \end{pmatrix}$$

## Composition of Linear Transformations Another example

Let  $T: \mathbb{R}^3 \to \mathbb{R}^3$  be projection onto the yz-plane, and let  $U: \mathbb{R}^3 \to \mathbb{R}^3$  be reflection over the xy-plane. Let's compute their standard matrices A and B:

## Composition of Linear Transformations

Another example, continued

So the matrix C for  $T \circ U$  is

Check: we did this last time

[interactive:  $e_1$ ] [interactive:  $e_2$ ] [interactive:  $e_3$ ]

## Properties of Matrix Multiplication

Mostly matrix multiplication works like you'd expect. Suppose A has size  $m \times n$ , and that the other matrices below have the right size to make multiplication work.

Most of these are easy to verify.

**Associativity** is A(BC) = (AB)C. It is a pain to verify using the row-column rule! Much easier: use associativity of linear transformations:

$$S \circ (T \circ U) = (S \circ T) \circ U.$$

This is a good example of an instance where having a conceptual viewpoint saves you a lot of work.

Recommended: Try to verify all of them on your own.

# Properties of Matrix Multiplication Caveats

### Warnings!

► *AB* is usually not equal to *BA*.

In fact, AB may be defined when BA is not.

▶ AB = AC does not imply B = C, even if  $A \neq 0$ .

▶ AB = 0 does not imply A = 0 or B = 0.

### Powers of a Matrix

Suppose A is a square matrix.

Then  $A \cdot A$  makes sense, and has the same size.

Then  $A \cdot (A \cdot A)$  also makes sense and has the same size.

#### Definition

Let n be a positive whole number and let A be a square matrix. The nth power of A is the product

$$A^n = \underbrace{A \cdot A \cdot \cdots \cdot A}_{n \text{ times}}$$

### Example

### Summary

- ▶ The product of an  $m \times n$  matrix and an  $n \times p$  matrix is an  $m \times p$  matrix. I showed you two ways of computing the product.
- Composition of linear transformations corresponds to multiplication of matrices.
- You have to be careful when multiplying matrices together, because things like commutativity and cancellation fail.
- You can take powers of square matrices.
