### Eigenvectors and Eigenvalues Reminder

#### Definition

Let A be an  $n \times n$  matrix.

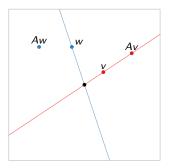

- 1. An **eigenvector** of A is a nonzero vector v in  $\mathbf{R}^n$  such that  $Av = \lambda v$ , for some  $\lambda$  in  $\mathbf{R}$ .
- 2. An **eigenvalue** of A is a number  $\lambda$  in  $\mathbf R$  such that the equation  $Av = \lambda v$  has a nontrivial solution.
- 3. If  $\lambda$  is an eigenvalue of A, the  $\lambda$ -eigenspace is the solution set of  $(A \lambda I_n)x = 0$ .

### Eigenspaces Geometry

### Eigenvectors, geometrically

An eigenvector of a matrix A is a nonzero vector v such that:

- ightharpoonup Av is a multiple of v, which means
- ightharpoonup Av is collinear with v, which means
- Av and v are on the same line through the origin.

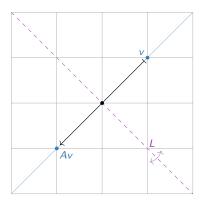

v is an eigenvector

w is not an eigenvector

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

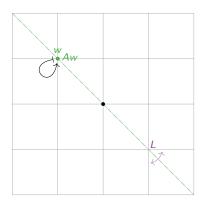

Does anyone see any eigenvectors (vectors that don't move off their line)?

v is an eigenvector with eigenvalue -1.

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

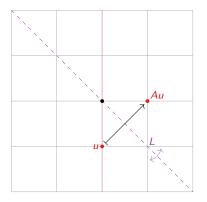

Does anyone see any eigenvectors (vectors that don't move off their line)?

 $\it w$  is an eigenvector with eigenvalue 1.

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

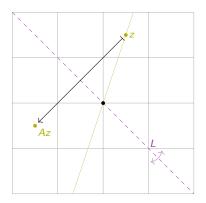

Does anyone see any eigenvectors (vectors that don't move off their line)?

u is not an eigenvector.

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

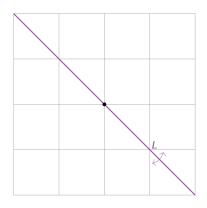

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)? Neither is z.

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

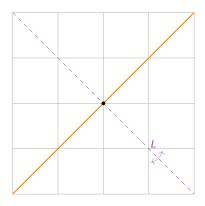

Does anyone see any eigenvectors (vectors that don't move off their line)?

The 1-eigenspace is L (all the vectors x where Ax = x).

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be reflection over the line L defined by y = -x, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

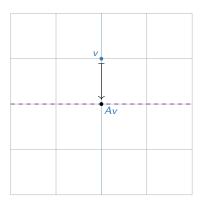

Does anyone see any eigenvectors (vectors that don't move off their line)?

The (-1)-eigenspace is the line y = x (all the vectors x where Ax = -x).

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

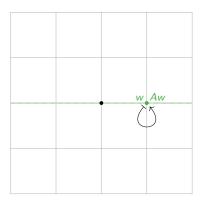

Does anyone see any eigenvectors (vectors that don't move off their line)?

*v* is an eigenvector with eigenvalue 0.

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

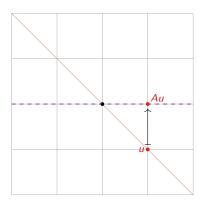

Does anyone see any eigenvectors (vectors that don't move off their line)?

 $\it w$  is an eigenvector with eigenvalue 1.

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

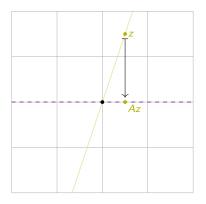

Does anyone see any eigenvectors (vectors that don't move off their line)?

*u* is *not* an eigenvector.

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

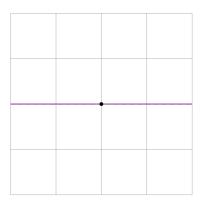

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)? Neither is z.

Let  $T: \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

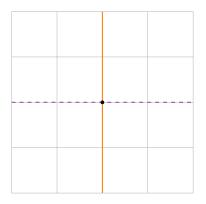

Does anyone see any eigenvectors (vectors that don't move off their line)?

The 1-eigenspace is the x-axis (all the vectors x where Ax = x).

Let  $T \colon \mathbf{R}^2 \to \mathbf{R}^2$  be the vertical projection onto the x-axis, and let A be the matrix for T.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

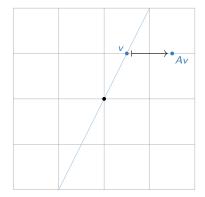

The 0-eigenspace is the *y*-axis (all the vectors x where Ax = 0x).

Let

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix},$$

so T(x) = Ax is a shear in the x-direction.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

Vectors v above the x-axis are moved right but not up...

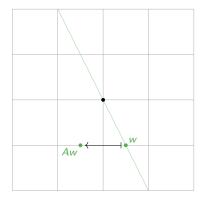

so they're not eigenvectors.

Let

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix},$$

so T(x) = Ax is a shear in the x-direction.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

Vectors w below the x-axis are moved left but not down...

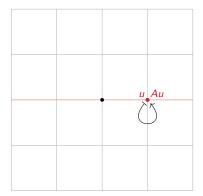

so they're not eigenvectors

Let

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix},$$

so T(x) = Ax is a shear in the x-direction.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

 $\it u$  is an eigenvector with eigenvalue 1.

Let

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix},$$

so T(x) = Ax is a shear in the x-direction.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

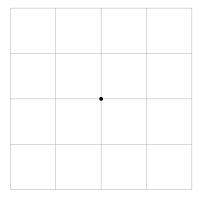

The 1-eigenspace is the x-axis (all the vectors x where Ax = x).

Let

$$A = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix},$$

so T(x) = Ax is a shear in the x-direction.

Question: What are the eigenvalues and eigenspaces of A? No computations!

Does anyone see any eigenvectors (vectors that don't move off their line)?

There are no other eigenvectors.

### Section 5.2

The Characteristic Polynomial

### The Characteristic Polynomial

Let A be a square matrix.

 $\lambda$  is an eigenvalue of  $A \iff Ax = \lambda x$  has a nontrivial solution  $\iff (A - \lambda I)x = 0 \text{ has a nontrivial solution}$   $\iff A - \lambda I \text{ is not invertible}$   $\iff \det(A - \lambda I) = 0.$ 

This gives us a way to compute the eigenvalues of A.

#### Definition

Let A be a square matrix. The characteristic polynomial of A is

$$f(\lambda) = \det(A - \lambda I).$$

The characteristic equation of A is the equation

$$f(\lambda) = \det(A - \lambda I) = 0.$$

#### Important

The eigenvalues of A are the roots of the characteristic polynomial  $f(\lambda) = \det(A - \lambda I)$ .

# The Characteristic Polynomial Example

Question: What are the eigenvalues of

$$A = \begin{pmatrix} 5 & 2 \\ 2 & 1 \end{pmatrix}?$$

### The Characteristic Polynomial Example

Question: What is the characteristic polynomial of

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}?$$

What do you notice about  $f(\lambda)$ ?

- ▶ The constant term is det(A), which is zero if and only if  $\lambda = 0$  is a root.
- ▶ The linear term -(a+d) is the negative of the sum of the diagonal entries of A

#### Definition

The trace of a square matrix A is Tr(A) = sum of the diagonal entries of A.

#### Shortcut

The characteristic polynomial of a  $2 \times 2$  matrix A is  $f(\lambda) = \lambda^2 - \mathrm{Tr}(A) \, \lambda + \det(A).$ 

$$f(\lambda) = \lambda^2 - \mathsf{Tr}(A)\,\lambda + \mathsf{det}(A)$$

## The Characteristic Polynomial Example

Question: What are the eigenvalues of the rabbit population matrix

$$A = \begin{pmatrix} 0 & 6 & 8 \\ \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{2} & 0 \end{pmatrix}?$$

### Factoring the Characteristic Polynomial

It's easy to factor quadraic polynomials:

$$x^2 + bx + c = 0 \implies x = \frac{-b \pm \sqrt{b^2 - 4c}}{2}.$$

It's less easy to factor cubics, quartics, and so on:

$$x^{3} + bx^{2} + cx + d = 0 \implies x = ????$$
  
 $x^{4} + bx^{3} + cx^{2} + dx + e = 0 \implies x = ???$ 

Read about factoring polynomials by hand in  $\S 5.2.$ 

### Summary

We did two different things today.

First we talked about the geometry of eigenvalues and eigenvectors:

- ► Eigenvectors are vectors *v* such that *v* and *Av* are on the same line through the origin.
- You can pick out the eigenvectors geometrically if you have a picture of the associated transformation.

Then we talked about characteristic polynomials:

- We learned to find the eigenvalues of a matrix by computing the roots of the characteristic polynomial  $p(\lambda) = \det(A \lambda I)$ .
- ▶ For a  $2 \times 2$  matrix A, the characteristic polynomial is just

$$p(\lambda) = \lambda^2 - \text{Tr}(A)\lambda + \text{det}(A).$$
